Dataset schema: raw signal time-series -> one row per market (each dimension = {level, growth}, z-scored)

(A) Raw corpus - a dated monthly series per (market, signal). TIME LIVES HERE.

market	month	signal	value
semiconductors	2012-01	patents	3,981
semiconductors	2012-02	patents	4,140
semiconductors	...	...	...
cyber-security	2016-01	github_stars	1,180
cyber-security	2016-01	arxiv (cs.CR)	42
...	...	...	...

↓ window to [t0, t0+k] -> reduce to LEVEL (how much) + GROWTH (accelerating?) -> z-score across markets -> roll into dimensions

(B) Modeling dataset - ONE row per market. Cells = level-z / growth-z. — = no channel (masked, not 0).

market	cohort	capital/ entrant	Attention {L/G}	Research {L/G}	Adoption {L/G}	Innovation {L/G}	TARGET rate
devops	98	4.9M	+0.1/+0.4	—	+0.9/+1.1	—	**9.2%**
data-analytics	2,796	2.2M	+0.6/+0.2	—	+0.5/+0.3	—	**3.4%**
cyber-security	939	4.0M	+0.7/+0.5	+0.4/+0.8	+0.3/+0.6	+0.5/+0.4	**6.7%**
semiconductors	199	1.3M	+0.2/-0.1	+1.5/+0.2	—	+1.8/+0.3	**4.5%**
biotechnology	2,873	3.5M	+0.5/+0.1	+1.2/+0.4	—	+0.9/+0.2	**5.5%**

built (real): Crunchbase columns + Innovation (patents, semiconductors shown). to fill: Attention (wiki/HN), Research (arXiv), Adoption (GitHub/pkg). dark headers = built, grey = in progress.
